# e-Stream™ Waste-Stream Analysis

**Your organization is liable for whatever it delivers to a landfill.** A waste stream analysis can help you manage that risk and identify cost saving opportunities with waste reduction, re-use and recycling.

*EMS Environmental* offers clients the **e-Stream™** Waste-Stream Analysis to identify opportunities for waste reduction, re-use, reconstitution, recycling and more responsible handling. This analysis identifies exposure to potential future liabilities and the environmental value of potential actions. **e-Stream™** analysis considers both your processes and the supporting facility to identify both facility and operating opportunities and their relative importance.

From **e-Stream™**, you get:

- Assessment of your operation's waste sources, including materials and volumes
- Assessment of disposal costs
- Re-use, Reconstitution and Recycling opportunities
- Immediately Actionable waste-stream recommendations based on the type of waste, waste volumes and where it is going
- Framework for longer term feasibility/design and procurement specifications
- Public Relations opportunities - customers and employees want to associate with environmentally responsible organizations

*EMS Environmental*'s experience with disposal regulations, permitting, remediation, recycling opportunities and waste analysis enables you to make informed decisions.
